

Short biography of Francesco sisini

Francesco Sisini is a physicist with a PhD in radioisotope techniques. He has conducted scientific research and published several peer-reviewed articles in international journals. Since 2016, alongside his scientific work, he has been developing a literary practice centred on stories shaped by science and technology, initially through self-publishing. Over the past six years, he has also devoted himself to teaching, an experience that has brought him into daily contact with younger generations and with their ways of engaging with science, technology, and contemporary society.

These experiences eventually led him, together with his wife, to establish Edizioni Tradizionali, an independent publishing project conceived also as a space for experimenting with forms of scientific narrative that move beyond the conventional boundaries of the genre. His current literary research explores the possibility of building narratives around Europe's major scientific, technological, and political infrastructures, treating them not simply as settings, but as part of the structure of the narrative itself and as a means of exploring the transformations and crises of contemporary Europe.
